

Common Deergrass *Trichophorum germanicum*

True sub-stomatal pits very SMALL - see right.
(However, these often linked to small regions of aerenchyma, as shown, which have large clear cells, but no lining of smaller cells.)

Distinctively 'holey' appearance in cross-section

Sub-stomatal pits TINY, no more than $7 \mu\text{m}$ deep (i.e. radially); often difficult to see

(Vascular bundles)

Each segment of green tissue (chlorenchyma) with two patches of clear cells in cross-section, making vertical air-channels (aerenchyma)

Stoma
